

## THE UNIVERSAL POWER

We are reprinting drawings, and data, in this issue of the "Proceedings" that we printed in November and December of 1954, and January of 1955. This information may not be of any value to many of our readers, but we feel it is important to some of our readers around the world because of recent verification.

In 1954 and 1955, our space program was still in its planning stages. Nobody had ventured into space.

In December of 1954, we printed data on a field around the earth which we called "the earth's force field". Four years later our first space probes verified this information, and it was named the "Van Allen Radiation Belt".

In the illustrations, in this article, also printed with the information in 1954 and 1955, we printed the principle of "Celestial Mechanics" explaining what makes a solar system work.

Recently N.A.S.A. and the Russian space program, printed data on the measurement of linear lines of energy in space in a rhythmic wave motion of 8 cycles per second. These are the lines shown in these reprints which we called "the positive lines of force". These are the vertical lines in all three drawings. When science develops some method of measuring the negative lines of force, shown horizontally in these illustrations, then they will begin to understand the birthplace of atoms and solar systems.

The reprints follow, with only part of the information originally printed in the "Proceedings":

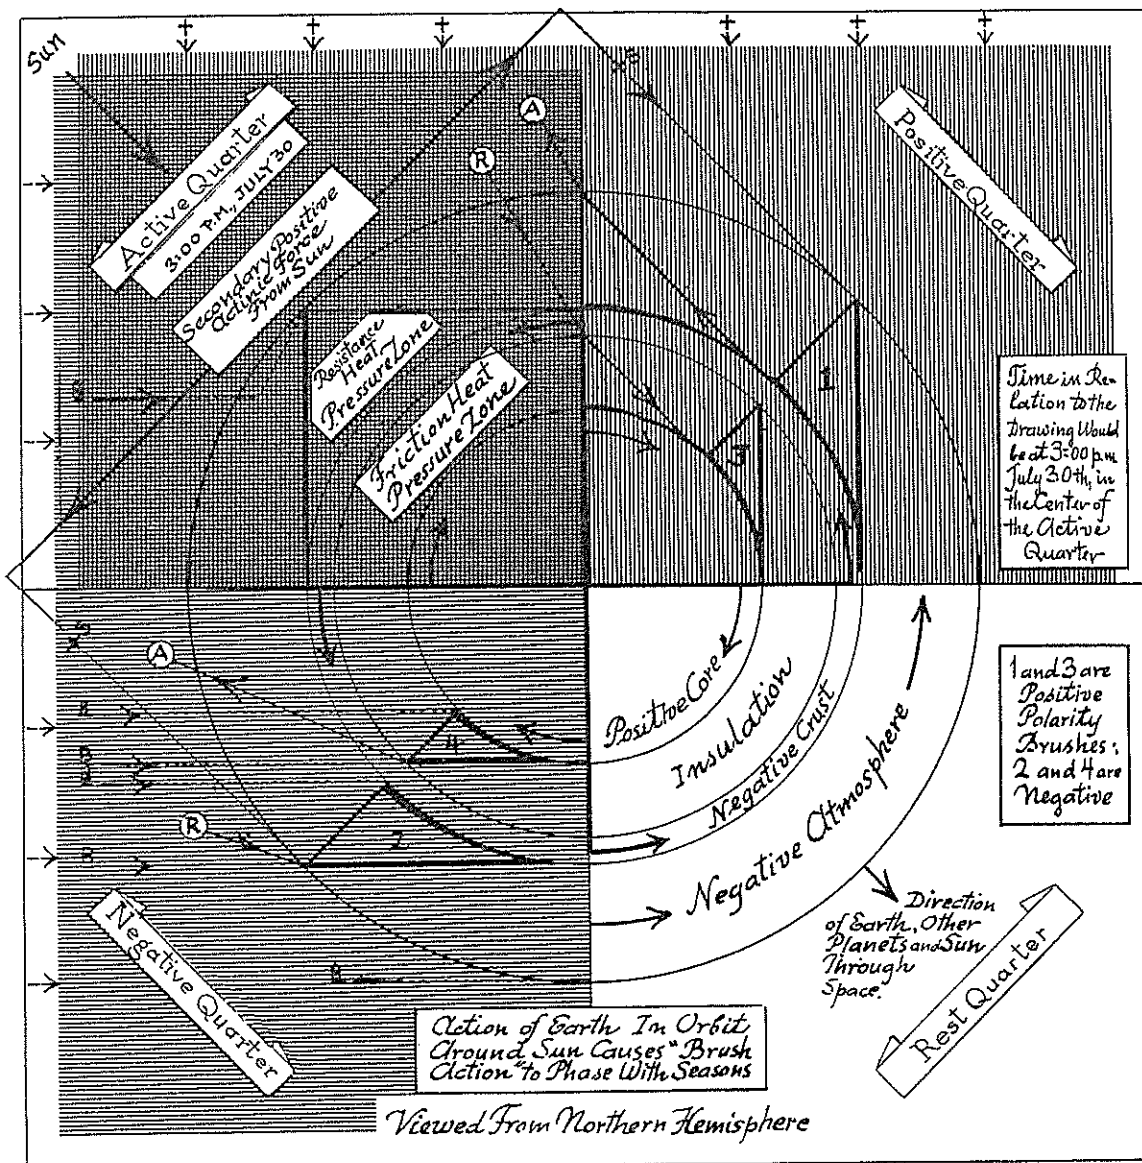

### The Earth As A Motor

The positive and negative lines of primary light energy cause all motion. Humans, atoms, suns, planets and galaxies are all powered by the same forces.

The Earth is an oversize electron of a predominantly negative polarity. Its rotation and orbit are the result of attraction and repulsion to the lines of primary light energy.

The drawing is made with the Sun shining in the center of the Active Quarter from a 45 degree angle. The Sun is the alternator that changes polarity predominance from one hemisphere to the other every six months.

The circles inclosing the "A" and "R" indicate the direction of the attracting and repelling forces. The Negative Primary Light attracts the positive core in the Negative Quarter and repels the negative crust. The opposite is true in the Positive Quarter. These two attracting and repelling "brushes" are changing position continuously as the Earth orbits.

The Moon is one of the bodies acting as a governor to the Earth. The Earth's tides are a "fluid drive" connection between the motor-generator-battery Earth, and the governor Moon.

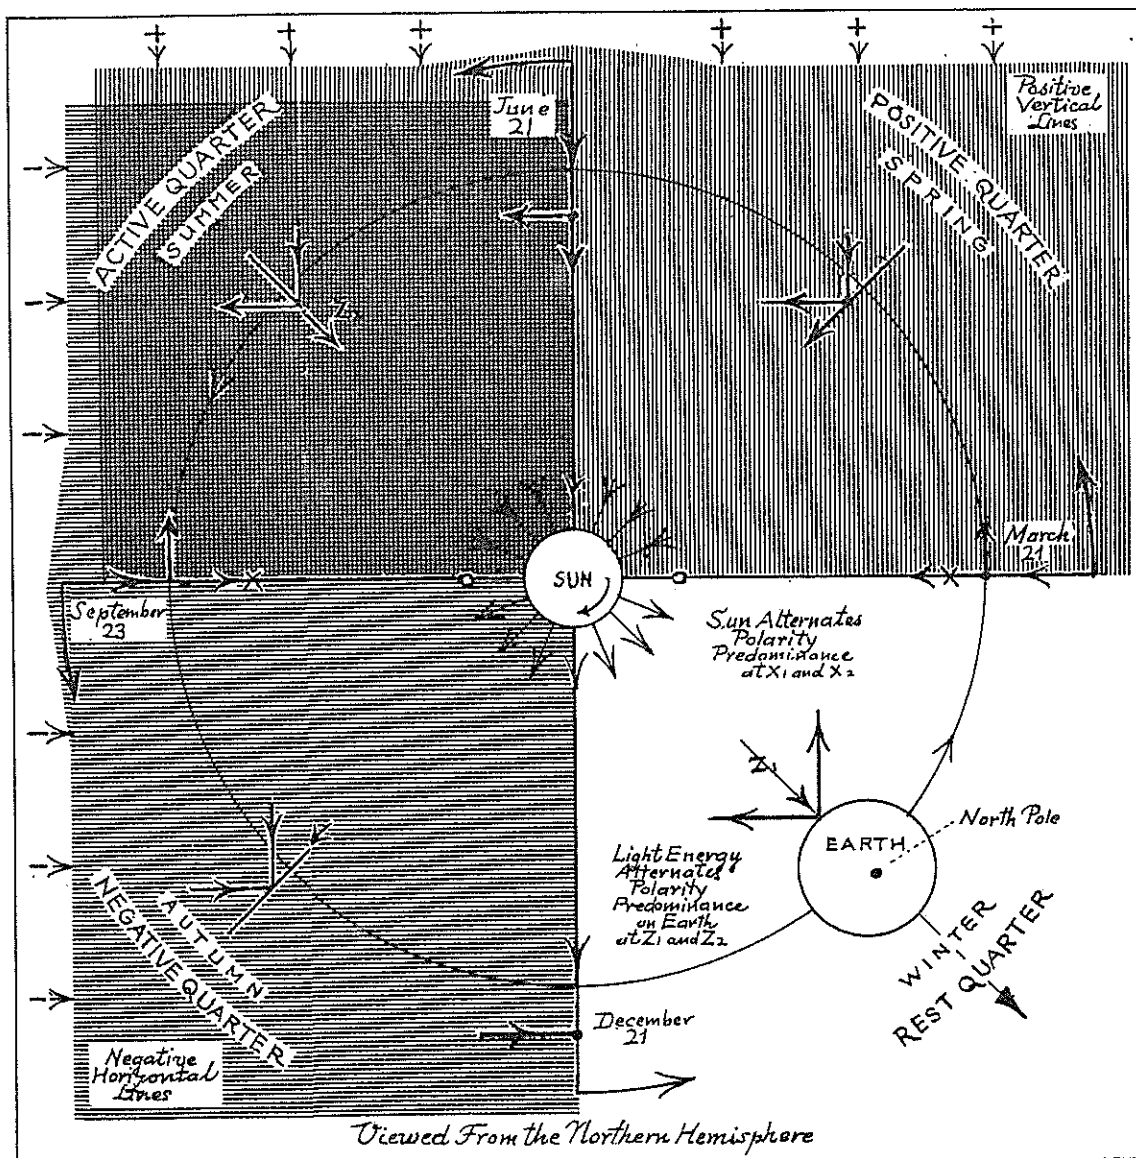

Gravity of the Moon has no effect upon the Earth. The only effect of the Moon upon the Earth is by polarity action on the Earth's force-field and by interruption of the light lines of force.

The Earth is surrounded by a self-generated force-field. Nothing inside of the Earth's force-field is affected by anything outside of it, except through the attracting or repelling effects of polarity in the lines of light energy or the Sun.

From 6 P.M. to Midnight cast the Negative Quarter. Both the positive lines of light-energy and the Sun's attractive forces are eliminated and the negative lines of light-energy maintain only the heat of resistance by repulsion. The forces of the Active Quarter fade away and the negative physical bodies of people become tired and sleepy during the Negative Quarter.

In the Rest Quarter, from Midnight to 6 A.M., the Sun's positive force, the positive lines of light energy, and the negative lines of light energy set up no resistance of attractive or repelling forces. So the atmosphere and crust cool off in the coldest quarter of the cycle, because the surface is shielded from the three forces by the planet.

Our effort, in this article, is to bring to the layman's mind the understanding of light-energy as applied to the orbits of galaxies, planets, or electrons.

Every planet in the universe moves in curved lines of travel. This is not because they were thrown off by a Sun, or central body. If they were, they would not orbit. Anything thrown off of a rotating object will travel in a straight line outward, though it may fall because of gravity on the Earth. The reason planets, or electrons orbit around a central body is — they are powered by light-energy.

Once again, get this straight in your mind — positive or negative light-energy cannot be seen by physical vision. They are both invisible unless they encounter resistance in opposition. They extend infinitely throughout all space and penetrate all bodies in ratio to their densities.

In the drawing of our central Sun and the Earth in its cyclic orbit is the explanation of the only way to square the circle.

Light-energy squares the orbit of every body that travels in it. Light-energy powers everything that manifests motion whether directly, or indirectly.

The Moon and the Earth are both of negative polarity — as are all humans in their physical substance and all bodies that can be seen by reflected light.

All negative bodies generate a positive force-field and all positively charged bodies generate a negative force-field.

The atmosphere is actually a part of the crust and is of the same polarity. It acts as a bearing for the crust to turn in. The atmosphere and oceans are affected by the helical vortice set up in each hemisphere in opposite directions. This is caused by the depleted lines of primary light giving their energy to motion of the planet. As they are depleted they try to reach rest, like people, so they head for the point of least motion; which is at the poles. Naturally the polarity seeks opposite polarity.

The small arrows, shown on the Moon, indicate the direction of forces set up by polarity affecting the Moon. The A arrows represent attraction forces and the R arrows stand for repelling forces. At all times these forces are changing their predominance until the zero point of curvature is reached, which establishes the Moon's orbit around the Earth. The Moon's orbit speed is fixed according to its charge of negative polarity.

Everything on the Earth is affected by the Moon's interruption of the positive and negative lines of light energy. Though this effect is variable it is apparent in tides, crops and people. At points where the Moon interrupts the positive — or negative — lines of light energy, natural magnetic vortices — on the Earth — may cease their rotation for an interval of time, or rotate in the opposite direction.

The secondary light rays from the positive Sun and the positive lines of light energy warm the morning cycle from 6 A.M. to 12 Noon. This occurs by the attractive, resistance heat effect in our negative atmosphere and the crust of the Earth. The force-field does not decrease these polarity effects because their polarities are both positive, therefore they offer no resistance to each other.

The heat registered during the hottest part of the day is in the Active Quarter from 12 Noon to 6 P.M. Higher temperatures are registered in this quarter because the Sun and positive lines of light-energy are setting up attraction resistance within our atmosphere and the negative lines of light-energy are setting up repelling resistance. Two forces are working in attraction to the force of the Earth's polarity and one force is working in opposition to it. The negative lines of force also meet resistance of the positive force-field, which acts as a parabolic reflector.

The polarity predominance alternates between the northern and southern hemispheres of the Earth and causes the force-field to oscillate. The erratic orbit path of the Moon follows the oscillations of the Earth's force-field. The Earth's positive force-field rotates opposite to the Earth and the Moon's orbit. Interruptions of the light lines of force by other bodies or planets causes variable effects on the Earth and its reactions are transmitted to its self-generated force-field. These influences cause the oscillations to vary and hence the Moon's orbit is variable.
