

Chapter 11

An Inhabited Solar System

Venus, Mars, and the Moon are important in that they are our closest neighbors, and the habitability can easily be determined. Our space program of the 1960's and 70's probed and photographed them extensively, since these planets were known to be the homes or bases of the UFOs. Life beyond the Earth should have been published as an established fact years ago. Two things prevented this from becoming our rightful knowledge: the inability, and often the refusal, of the orthodox scientists to go beyond their shared perceptions; and secondly, the absolute secrecy and censorship by the top-level authorities in charge of the space program.

But what about the other planets in our solar system? Are they inhabited also? And are their environments Earthlike, or similar enough, that we could travel to them and step out on their surfaces?

George Adamski stated early on that they were inhabited, for he got his information direct from the space people. Textbook scientists and JPL staff say no, based on the old theories, but they do not have any direct information from scientific instruments. To date, scientists have no way of knowing, because we have not probed beneath the atmospheres of the other planets or landed any instruments. And until they understand the true nature of the sun's energy, gravity, and magnetic fields, their speculations will be way off the mark.

All that has been achieved is some preliminary picture-taking from vast distances during momentary fly-bys. For example, the closest pass to Jupiter by a Voyager probe was at

a distance of 166,000 miles. Any so-called measurement from that distance would be purely hypothetical. And until scientists can see the UFO evidence here on Earth, and see the true environments of Venus, Mars, and the Moon, there is no reason to accept their opinions regarding the more distant planets. Their speculations are only extensions of theories that have become scientific dogma. There is simply no data which could prove or disprove the theories. In other words, from a purely scientific standpoint, the planetary conditions on either Mercury, Jupiter, or Saturn is still an open question. The same is true for the planets beyond Saturn.

In order to discuss Mercury, the last of the four inner planets of our system, it is important to first have a true perspective of spatial distances. Diagrams in books and magazines are invariably out of proportion due to an inadequate page size, and Mercury is perceived as being very close to the Sun. In space the planet's actual distance from the Sun is 34 million miles.

The following is an accurate representation that could be laid out in a large yard or playground. If the Sun were the size of a regulation basketball, the Earth would be the size of a small BB placed 90 feet from the basketball. A smaller BB for Mercury would circle the basketball from a distance of 33 feet. To complete this scaled representation, a BB for Venus would be placed at 65 feet, and another for Mars at 132 feet. The actual size of a BB is ●. Try and picture in your mind these sizes and distances for a moment.

Seeing Mercury as a small BB located 33 feet from the basketball, we find that it is not really close when seen at true scale. The planet is usually described as being very similar to the Moon on its surface, and like the Earth on the inside. As early as 1962, radio astronomers found that the night side hemisphere had a warm surface - an effect which would require that an atmosphere be present to carry the heat from the day side to the night side. It was also determined from further studies that Mercury had a thin atmosphere. The methods used were similar to those used for the Moon, (and like the case of the Moon, this means that the density of

Mercury's atmosphere will have to be revised upwards when more accurate methods are employed.) When the atmosphere is accurately determined, we will also learn that the surface temperatures on Mercury are quite moderate.

The U.S. space program has sent only one space probe to Mercury. The spacecraft, Mariner 10, was placed into a precise orbit that allowed three brief fly-by encounters during a one year period from March 1974 to March 1975. These one and a half day encounters were the first close-up views of the planet, and a chance to investigate Mercury's magnetic field and its interaction with the solar wind. The mission was also supposed to check up on the "tenuous" atmosphere determined from radio astronomy, but either the Mariner 10 instrumentation was incapable of registering atmospheric effects, or NASA deliberately denied Mercury's atmosphere, the same as they have denied the Moon's. If Mercury did not have a sufficient atmosphere to offset internal pressures, it would have disintegrated and returned to the elements of space long ago.

The Mariner 10 fly-bys were nightside passes, and therefore photographs could not be taken at the close approach, but only from much greater distances during the orbital pass. In fact, it was the worst trajectory for photographing the planet's illuminated surface, and the end results required complicated imaging back at Jet Propulsion Laboratories. Resolution was compromised also, due to the lack of Congressional funding for a proposed x-band transmitter, designed to top specifications. All of this should be understood when looking at the photos of Mercury taken by Mariner 10.

The pictures are black and white, and look like common pictures of the Moon. Only the daylight half of the planet was observed by Mariner 10 in two hemisphere photographs. The first was taken from 124,000 miles as the probe traveled toward Mercury, and the second from 130,000 miles as it was traveling away from the planet. Broad surface area photographs were transmitted as Mariner's distance decreased to 11,000 miles, and while "looking back" as the spacecraft came out from behind the nightside hemisphere.

The scenes of highest resolution are indistinguishable from pictures taken by the early Ranger spacecraft missions to our Moon.

The spacecraft's orbit brought it to a second pass of Mercury six months later. Its closest approach was 30,000 miles on September 21, 1974. The third and final pass in March 1975 brought it to within 6,000 miles, but only very small areas were picked up with slightly improved detail. The reason given for the much-lessened opportunity was that there was a failure with one of the Earth-based antenna systems. However, a few high resolution transmissions, showing features of 3 kilometer size, discovered water or river channels in an area now dry. Orthodoxers suggested their standard silly interpretation: the features depicted in the photographs had resulted from the flowing of liquid rock. Generally, the other pictures look like the front side of our Moon - plains, craters, and flooded basins.

Space scientists were surprised to find a strong magnetic field at Mercury. This field acts as a protective shield to the sun's energy, and thus creates a bow shock in the solar wind, which was also confirmed by the Mariner probe. Scientists found that the bow shock was comparable and equivalent to the Earth's interaction with the solar wind.

Yet many conclusions came into conflict. The magnetic field at the surface was given as 1% of the Earth's, but it is quite doubtful that our methods can accurately measure things we do not really understand, namely the gravitational and magnetic fields of planetary bodies. It has also been stated that the photographic fly-bys enabled the scientists to confirm the very slow (59 day) rotation rate of Mercury, due to the fact that the same hemisphere was in view at each of the 3 encounters separated by 6-month intervals. This apparently confirmed an earlier theory, that while circling the sun twice, the planet would rotate 3 times on its axis, giving a ratio of 2:3. But any multiple of 3 would present the same exact face at flyby. Since a strong magnetic field is required to create a strong bow shock in the solar wind, and since a strong planetary magnetic field is generally attributed to the

fast rotation of a planet, I do not think that we have heard the final answer as to the length of a day on Mercury.

Because the public only sees the end results of a space mission as a series of photographic images in a magazine article, people are very apt to think of a planetary encounter as a live broadcast from space by the spaceprobe. Actually, the probe is exploring in the dark, and its various instruments have uncertain sensitivities to atmospheric frequencies, radar waves, solar intensity, magnetic fields, and cosmic radiations. Photography is nothing more than limited electronic detection of surface illumination contrasts, which must be interpreted by computer imaging back on Earth. The various instruments send their non-absolute indications millions of miles to Earth in the form of very faint radio signals. These signals are barely discernible from the constant radio noise coming to Earth from space itself, and sometimes indistinct from the high frequency noise of the components used to receive the signals.

For example, eight scans by an ultraviolet spectrometer on Mariner 10 were sent back, and initially the signals were interpreted as Mercury having a moon, or satellite. Project scientists thought that they had discovered a moon circling Mercury. The readings were later identified as radio emissions from a 5th magnitude star that was light-years away! And is this not the same type of instrument as the mass spectrometer - that device which has always been the instrument for subjective analysis of planetary atmospheres?

Our space probes operate in unknown zones, pick up some type of frequency, from some type of emission, in a vast and complex planetary field. Something registers, and a feeble signal is transmitted to an Earth-based receiver. Schooled in orthodoxy, project scientists try to interpret the signal. Our space probes are exploring and groping in the dark, so to speak. Their capabilities at present are like looking at a drop of water with a magnifying glass. Compare that with looking at a drop of water with an electron microscope, and you realize what stage of confirmative knowledge we are at in

planetary exploration.

A Mariner 10 photograph of Mercury is shown in Plate 26, and first indications reveal that its surface does look like the Moon. In fact, its environment may be very much like the Moon. Readers of this book are aware that there is a lunar civilization and life-supporting conditions on our satellite. When we get the full and correct pictures of the Moon from our space agency, then we can expect to get the correct pictures of Mercury. In other words, since our Moon is inhabited (contrary to the official position of NASA), we may later find that Mercury shows a similarly inhabited environment, if and when we send out better space probes. Mariner 10 did not have the capability of proving or disproving life on Mercury. From a scientific standpoint, it is still an open question. But just as the electron microscope can reveal a whole new world of activity in the drop of water which the magnifying glass cannot see, so too will our probes discover the actual world of Mercury, when their capabilities are increased 10,000-fold. This same analogy can be applied to the present state of knowledge regarding Jupiter, Saturn, and beyond.

W.R. Drake's researches into classical literature and ancient manuscripts found many references to Mercury. One of the suppressed biblical accounts, the Book of Enoch, describes how Enoch was taken into space (the heavens) and transported to various planets, including Mercury. On this celestial journey he was shown the grand design and motions of the solar system. Enoch's ancient account tells of the round shape of the Earth and how our world is inclined on its axis. That knowledge could only be learned from contact with a space civilization.¹ Enoch went on to be an inspired prophet in the cradle of civilization in Sumeria.

Panini, a Sanskrit historian and writer, wrote an account of how he and others had been taken on space trips to Mercury and Venus by the friendly extraterrestrials during the fourth century A.D.² The famous philosopher, scientist, and astronomer of the 18th century, Emmanuel Swedenborg, after publishing great works in scientific discoveries and fundamental theories, intimated that his knowledge had

come from (telepathic) intuition originating with space people from Mercury.³ In 1866, three professional astronomers saw an unexplainable light on the nightside half of Mercury. M.K. Jessup attributes this telescopic observation to a brilliant UFO close to the surface of the planet, just as UFOs have been seen over the Moon.⁴

These are a few of the references to Mercury from the records of history. Intelligent men in the past learned, or otherwise gave indication, that Mercury was a living planet. In our recent history of space visitations, this fact has surfaced again. Officials are more certain with Venus and Mars, but the world has a lot of learning to do. On Earth, mankind laughs at the thought of a divine purpose to creation, denies that there is any other life within light years of our little spot in the galaxy, and contemptuously threatens this most beautiful globe with nuclear bombs. His mind is so divorced from cosmic principle and intuition, that we cannot call it intelligent.

Volumes have been written on Jupiter and Saturn, based on nothing but a belief. The theory that these planets are large bodies of swirling gases around a liquid core became a fundamental cornerstone of organized astronomy - forever entrenched, never questioned. The psychology of the situation is almost medieval, because the theory is taught as absolute fact by the theologians of science. And if one is paid as a scientist, one has to write and write, with the result that the original belief now expands into volumes of meaningless, nonsensical concepts. Supposition upon supposition, until natural inquiry is stifled, then suffocated.

It was Einstein who said: "It is, in fact, nothing short of a miracle that the modern methods of instruction have not yet entirely strangled the holy curiosity of inquiry." John Goethe, the great German philosopher, once declared that so-called education was expressly designed to make sensible people stupid.

The theories have not changed, but the present discourses on Jupiter and Saturn are based on the picture-taking flybys of the Pioneer and Voyager probes. The more sophisticated

cameras were on the hardy Voyagers, and the closest approach to Jupiter was 166,000 miles by Voyager 1, while Saturn was passed at a 63,000 mile distance by Voyager 2 in August 1981. Most of the photography was taken from much greater distances. The two probes' electronic scanning signals were converted into pictures back on Earth, and in the case of Jupiter, computer-enhanced into false color. We did get a few close-up images of both of the planets' moons, and a more detailed look at Saturn's rings.

The Voyager photos of Jupiter that were released show bright orange and red bands. This was an exaggeration, in order to support the usual description of Jupiter's "storm-wracked atmosphere." The actual colors as seen from space are soft blues and yellow, and blue-green. This was confirmed by California astronomer Andrew Young.⁵ The best available photographs of Jupiter and Saturn are reproduced in the illustrations.

In reality, both planets have solid surfaces. Jupiter has atmospheric zones for thousands of miles above its surface, which balance and blend with the sun's energy to make a habitable environment. The earth-like surface of Saturn lies many thousands of miles below its atmospheric firmament. Many advancements in understanding of electromagnetic fields and cosmic science will be required in order to replace the old theories with correct knowledge.

George Adamski gave a complete explanation for the habitability on the more distant planets, and the following is taken from his book, *Flying Saucers Farewell*.

"One of the most frequent problems encountered when giving a lecture on space is the insistence of scientists that the outer planets are devoid of light and heat. Their objection is that radiation from the sun is so weak at these vast distances that Pluto, for instance, would be at absolute zero or close to it, with a frozen atmosphere, and totally incapable of supporting life-forms of any type.

This is the main argument brought against me when doubt is expressed about my meeting human

beings from some of these other planets.

The first thing to realize is that the sun does not emit light and heat in the form we observe here on Earth. Radiation from the sun does not manifest itself as light and heat until it penetrates the atmospheres of the planets themselves. Outer space is devoid of light as we know it. The light in outer space is a cold light caused by the phosphorescence of vast clouds of particles and gases responding to the radiation given off by the sun. To a human observer, outer space looks like a dark, vast void, filled with billions upon billions of tiny specks of multicolored light. All of these tiny lights are in a state of continuous motion and activity.

Radiation from the sun is composed of ultra-violet light, hard and soft X-rays, cosmic and gamma rays. The greater portion of these destructive rays are filtered out by a planet's ionosphere and upper atmosphere. The innumerable, infinitesimal particles within a planet's atmosphere emit visible light when excited by the sun's filtered radiation. The earth absorbs these rays, and in return gives off infra-red energy. Energy thus given off activates the atmosphere immediately surrounding the planet, thereby generating heat that keeps the planet warm.

It is easy to see how this energy from the sun can encompass our earth. After all, we are only 93 million miles from the sun. But what about the planets that are more remote from the sun?

According to standard textbooks, the radiation from the sun decreases inversely with the square of the distance. In layman's language, this means that if you double the distance from the sun, the radiation would be only one-fourth as great. If you double the distance again, the radiation would be only one-sixteenth as great, and so on. If the sun's radiation actually decreases at this rate, then the outer planets must indeed be in a state of perpetual coldness.

What, then, is the answer? I know from personal experience that these outer planets have thriving civilizations, with climates and atmospheres

similar to our own earth. The larger planets, such as Saturn and Jupiter, have much lower gravity than has been assumed by our scientists. Therefore, our explanation of gravity must be in error in some way.

Our main problem now is not gravity but climate. How do these planets receive enough energy from the sun to exist in a similar state to Earth?

A clue to this answer is found in the vacuum tube; more specifically it is found in the cathode ray tube. This tube, abbreviated CRT, is found in the ordinary home television receiver. In it we have a heater that raises the temperature of a cathode to a point at which it gives off electrons in great quantities. These electrons are negative in nature. High positive voltages are supplied to various grids and anodes in the tube.

There are two types of electricity: positive and negative. The electron is negative and its counterpart, the proton, is positive. Just as the north pole of a magnet will attract the south pole of another magnet, the electrons attract the protons. Similar poles of magnets repel each other and so do similar charges of electricity. Likes repel; unlikes attract.

The high positive voltages on the grids and anodes of the CRT attract the electrons from the cathode. The electrons are pulled toward the anodes with great speed, but, due to the type of construction of these anodes, most electrons rush right on through toward the next one. Theoretically, this could be continued for great distances by use of several different anodes and high positive voltages.

Mercury, Venus, Earth and Mars are close enough to the sun to get good radiation. With the planets beyond Mars it is a different situation. At these distances the sun's radiation has started to diminish. At this time it comes under the influence of the tremendous attracting force generated by the first asteroid belt which totally envelopes the central position of our solar system. The negative charge of the asteroid belt is great enough to attract the particles from the sun and pull them back up to their original

speed. Because this belt is grid-like in construction, with thousands of openings and paths, similar to a window screen with air going through, the particles dash on through and enter the influence of the planets beyond.

These, being negative in themselves, as are all planets, attract from space the positive particles they need for light and heat. At the same time infinite numbers of similar particles rush on past and are attracted by a second asteroid belt between Neptune and Pluto, where the process is repeated all over again. This furnishes Pluto and the last three planets with normal light and heat. (Twelve planets in all exist in our system, according to the space travelers.)

A third asteroid belt is beyond the twelfth planet, serving a dual purpose of blending space within our system with that of neighboring systems. At the same time it serves as a protective filter, comparable to the ionosphere encompassing a planet.

We might summarize by saying: The two inner asteroid belts gather rays from the sun and speed them on through space. They equalize, so to speak, conditions within the system from the area of Mercury right on to the outer reaches of our solar system, while the third keeps our system, as a unit, in balance with those beyond. Because of this cosmic activity, of which we on Earth have not previously been aware, we could go to any of our planets and enjoy a climate and atmosphere similar to our own."

Following this discussion, Adamski explains how the asteroid belt acts as a dielectric (as in a capacitor which stores electrical energy) by trapping a portion of the sun's energy, while at the same time imparting energy to particles passing through. This alternating-current action effectively makes the asteroid belt an incubator of electromagnetic energy. This net attraction of the sun's positively charged particles should register as higher kinetic energy (temperature) by a space probe passing through the zone.

Voyager I passed this zone that lies between Mars and

Jupiter in 1978, and found it to be the hottest spot ever measured in the solar system. The temperature was at least 100 times that of the sun's surface.⁶ There is no real heat though, since the interplanetary region is a near-vacuum, whereas the plasma fields around the sun are extremely dense. Therefore, the Voyager probe was measuring high kinetic activity of solar particles in the asteroid belt, which is exactly the description given 17 years earlier by Adamski in his book.

The spaceships that Adamski went on were motherships from Venus and Saturn. The people he met on these craft were from Venus and Saturn, along with people from Mars - the three planets most responsible for helping the Earth in its transition towards the space age. But he was told that there was interplanetary cooperation throughout our solar system, and that people of all planets except Earth travel space freely. Every planet except Earth has spaceships.

Although Adamski's main contacts were from the same group, occasionally he met others from our system. While in Mexico in 1957, he had visits by space people who lived and worked in that nation. Two that he met came from different planets, namely Jupiter and Neptune. Adamski related this information in a letter to a European correspondent, and stated simply that having met people from five different planets of our system, he found no more difference between them, than between various nationalities on Earth. Apparently, the information Adamski received was of a universal nature relating to their work on Earth. Adamski had explained in his three published books that the other planets besides Venus, Mars, and Saturn were inhabited, but he indicated that he was not given specific information regarding the other planets.

As related earlier in this chapter, Adamski explained that there were three undiscovered planets beyond the orbit of Pluto, making a total of twelve planets in our solar system. This had first been revealed to him during a discussion on board a Venusian carrier ship, and stated in the book, *Inside The Spaceships* (1955). The simplicity of this statement lay

dormant for 28 years.

In January 1983, NASA placed a space telescope, the Infrared Astronomical Satellite (IRAS), in an orbit 560 miles above the Earth. For the first time ever, it revealed the outer reaches of our solar system, which had previously been invisible to astronomers because of the deep layer of atmosphere around our planet. High above the atmospheric interference, this 22.4 inch telescope was so sensitive that it could have detected a 20-watt light bulb on Pluto. For the first few months, astronomers at JPL tested their computers, and by summer, released some sketchy details on the discovery of new comets, asteroids, and mysterious bands of dust circling the sun between Mars and Jupiter. Then the press was given a stunning disclosure in October.

The orbiting telescope IRAS may have sighted at least one new planet, and more planets may come to light next week when astronomers gather here.

"There's a very good chance that IRAS will identify a new planet or two circling the sun beyond the orbits of Neptune and Pluto," said Nick Gautier, an infrared astronomer from the University of Arizona.

-USA Today, 10-31-83

The press did not get any more information on that discovery. And NASA was furious that the astronomical community had bypassed JPL in announcing results to the public. Personnel were reprimanded, and NASA prohibited the release of any further data from IRAS. The only proper channel would be JPL, and staff spokesmen were not allowed to say anything until an upcoming press conference in November.

The space agency knew just what had to be told. NASA disavowed any previous "unauthorized" releases, and shifted attention to significant findings way out in the galaxy. Although admitting that scientists had analyzed only 2% of the data delivered by IRAS so far, NASA only emphasized the "steady stream of wonders" beyond our solar system - wispy clouds of interstellar dust and gas, the total

energy in the universe, the unknown chemical soup from which stars are born, and the temperature of galaxies.

At the November press conference they redefined the discussion of planetary findings to the "stunning discovery of a possible planetary formation circling Vega, a bright star some 26 light-years away." They added that it would take one of our spaceprobes 200,000 years to get there. "You would have to be made of wood not to be interested," said top JPL spokesman Carl Sagan.

The project director, Nancy Boggess stated, "A lot of chapters in the astronomy books will be rewritten when all the results are in," but she added that it could take another 30 years to plow through all the information received from the year-long IRAS mission.

But the astronomy books are never rewritten to tell the truth about our own solar system. Space discoveries are censored by the agency's top officials. In the case of IRAS, the Kitt Peak Observatory astronomers innocently disclosed the findings of planets beyond Pluto, not knowing the relative significance of the data. NASA of course, did know the significance, and therefore avoided refreshing any reporter's memory at the press conference. As for the general scientific community, it rarely grabs at a lead unless the fact is confirmed over and over, and NASA had conveniently diverted all attention to dull speculation concerning interstellar dust clouds and star systems that are light-years away. In a very short while, the public and the media's interest dies, and all is forgotten.

What is the significance of the discovery by IRAS that was noted by the Arizona astronomers? It confirms the knowledge brought forward by Adamski in 1955. The top officials behind our space developments for the past 25 years have been specifically prepared with information by intelligence agencies of the government. Adamski's relationship to the UFO field is known to be authentic, and his space information regarding our solar system is known to be solid information. He was the only contactee who gave valid and specific space information that could be confirmed later -

be it Venus, Mars, the Moon, or beyond. But for the space agency to confirm anything publicly, would also confirm the truth behind UFOs and our interplanetary space visitors. This they have been instructed not to do, since certain powerful interests are behind the suppression of UFO information.

Given the high uncertainties and unreliability of our space probe instruments, it has been a relatively easy task to leave the state of scientific knowledge about space in doubt, and generally allow the orthodox attitudes to prevail. Only the specific findings on planetary environments have to be carefully controlled, and suppressed. We have thoroughly covered that situation regarding NASA's missions to Mars, Venus, and the Moon. It was top priority policy, by following secret directives, to suppress data and censor findings that would reveal habitability on those planets, and any major findings that would support Adamski's space science information. How else could the authorities keep the UFO reality suppressed?

The image that has been promoted, and carefully nurtured by the bureaucracy, is that our solar system is dead and uninviting - incapable of supporting life, except for the Earth. Of course that image is false, and the space agency knows that completely. But as far as they have gone in exploring our planetary system, NASA is also secretly following Adamski's guidelines, for the authorities know it is the only truths that will be found regarding our solar system. The intelligence agencies of our government have prepared them with that information.

Of course, it is the major findings that would change public and scientific perspective that are carefully controlled, but minor data from space probes that correlate Adamski's statements on space has often surfaced. The latter is usually apparent to only a very discerning reader. The 1978 Voyager probe's measurement of the kinetic energy temperature of the asteroid belt has been discussed already. There has been this type of incidental information from a number of space shots.

For example, in 1960 a Pioneer probe on its journey

toward the Sun registered "magnetic" storms and disturbances three million miles from Earth, and found a gigantic magnetic field with an axis unrelated to the sun. This discovery by the experimental probe closely matched statements made by Adamski in 1955 in *Inside the Spaceships*. In 1976, the structure of the sun's magnetic field was determined for the first time from data returned by the Pioneer 11 spacecraft, which was thrown 100 million miles above the ecliptic plane of the solar system after passing Jupiter. The probe revealed that the sun's magnetic field envelops the entire solar system in an elliptical pattern that is split into northern and southern hemispheres by a thin sheet of electric current. Fifteen years earlier, George Adamski related this description in his book *Flying Saucers Farewell*, and he further explained that these elliptical magnetic fields between planets could be likened to alternating current. These alternating elliptical fields, extending from sun to planet, and from planet to planet, are the invisible bonds which balance the solar system, he added.

There is much more that could be said on this intricate, balanced relationship that pervades and encompasses the whole solar system. To put it simply, a disruption in one part of the system will affect the rest of the solar system. A major disruption in the "magnetic rivers" between neighboring planets could easily be caused by unrestrained nuclear warfare on Earth, thereby unbalancing the cosmic fields of space. Not only would space travel by the space people be endangered, but their own planetary environment could be seriously affected. Now perhaps, we can better understand all the UFO activity by Venus and Mars in observing our Earth "come of age."

It is not generally realized that Adamski published, lectured, and conveyed an extensive amount of information beyond his three well-known books. In this additional material there is many a key for the researcher. It also shows a continual flow of new information from his contacts in the 1960's, as he developed a space education program along philosophical and technological lines. Society's real growth

can only be developed from true space information and new applications in science.

In *UFology*, James McCampbell reviewed a case study of an encounter between an Air Force plane and a UFO. The original investigation of this incident was conducted by James McDonald and presented at the December 1969 meeting of the American Association for the Advancement of Science, with his (McDonald's) analysis later being published in a book covering that scientific symposium.⁷ Although neither man knew it, their detailed discussions of this incident supplied substantial corroboration of information given by Adamski years earlier, regarding the propulsion of spaceships.

An Air Force B-47 was on a training mission using the military's top ECM (Electronic Countermeasures) equipment, during a flight over the South-Central states in July, 1957. While flying at 35,000 feet, the aircraft commander and the co-pilot visually spotted a UFO, shortly after their navigation radar and two separate ECM receivers had electronically detected a rapidly moving object in the vicinity. The UFO suddenly appeared as an intense bluish-white light as it approached the aircraft. Thinking he might have to take evasive action, the flight commander was startled to see the UFO almost instantaneously change direction "and flash across their flight path from port to starboard at an angular velocity he had never seen matched in all of his twenty years of flying."

The pilot then received permission to ignore his flight plan and chase the object. He increased the B-47's speed to Mach 0.83 before turning to chase, and immediately the UFO pulled ahead. For the next hour and a half, and while covering about 800 miles, the UFO quite literally flew circles around the B-47, by performing extreme maneuvers to show that it could easily outfly and outdistance the military aircraft. During this whole time, the pilot's visual observations of the UFO from the cockpit coincided exactly with the UFO directions and signals detected by the on-board radar and the two ECM receivers, and also by ground control

radar from Texas to Oklahoma.

Readings from the ECM equipment were written as part of the official report of the UFO incident as follows.

"...intercepted at approximately Meridian, Mississippi, a signal with the following characteristics; frequency 2995 MC to 3000 MC; pulse width of 2.0 microseconds; pulse repetition frequency of 600 cps; sweep rate of 4 rpm; vertical polarity ...Signal moved rapidly up the D/F scope indicating a rapidly moving signal source; i.e., an airborne source..."

James McCampbell summarized the above data into a single statement, and said,

"This UFO was, in fact, pouring forth large amounts of electromagnetic radiation in a very narrow range of the microwave region and it was pulsed at a low, audio rate."

The following is taken from a transcript of a lecture and discussion given by George Adamski on May 4, 1955. There was a question from the audience asking about the frequencies involved in the running of the spaceships. Giving a general description in layman's terms, Adamski answered:

"The ships themselves carry frequencies from sixty to seventy thousand megacycles in full operation. Static electricity is electrical energy, like a speed that is not in motion. It is in motion, but not what we call motion because it is stillness. Magnetism is already propelling energy. You have to convert static electricity into propulsion, or a pulsating state, in order to use it."

Note that the ECM equipment on board the B-47 measured the UFO's radiating frequency at 3000 MC, which is consistent with the fact that the UFO was simply keeping pace with the 500 mile-per-hour speed of the aircraft. While in full operation, (and they have been tracked on radar flying in excess of 8000 mph in our atmosphere), Adamski says the

frequency of the ship's energy would be 60,000 to 70,000 MC. And his description of converting to "a pulsating state," agrees exactly with the ECM receiver detection that the UFO's electromagnetic energy was "pulsed at a low, audio rate."

The conclusions are simple. The highly classified incident did not come to light until McDonald's report in 1969. The case involved the first direct measurement of a UFO's energy field, and it was detected by sophisticated instrumentation on board a military aircraft. Adamski's information preceded McDonald's research, and McCampbell's notable review of the incident, by 14 and 18 years respectively. As Edward Ruppelt, the man in charge of Air Force investigations, once wrote, "What constitutes proof?"

The most significant aspect of this case remains to be discussed. When an investigator for the Condon Committee tried to research the case in 1967, he found that there was a total "security lid" on the incident. No reports could be obtained from Project Blue Book or the Air Defense Command. Details of the incident were finally secured through interviews with the pilot and two other officers of the B-47 flight. The pilot revealed that as soon as he landed following the UFO encounter, AF Intelligence went on board the plane and removed all the electronic countermeasures data and radar scope pictures that had been recorded during the flight. This was followed by intensive interrogation of the crew at the base headquarters by the Intelligence personnel. Lengthy questionnaires were completed, and submitted as part of the intelligence reports. The event and the information was classified in security beyond classification, and the crew was told nothing further regarding the incident.⁸ The direct confirmation of the energy associated with UFOs is always kept under the blanket of "national security."

With excursions into space by artificial means, our astronauts have to contend with the experience of weightlessness. Pictures televised back from orbit always show the crew and unsecured objects floating around the

cabin. In its harmless banter, media coverage never fails to comment on this accepted, and somewhat amusing, side-effect of "escaping gravity."

But in a related way, what is not laughable to the UFO censors is the description of true space flight given by George Adamski in *Inside the Spaceships*. Adamski and his space friends were not floating around the spacecraft in a weightless condition, because the ships utilize the natural energy forces in providing a gravitational field for the ship. And for the authorities to admit that the UFOs in our skies are interplanetary spaceships, would be to admit that this type of energy is within our immediate grasp. These spaceships are utilizing the natural electromagnetic energy of space for propulsion and for overcoming gravity. We could readily harness this natural energy for all our domestic use, including land transportation, heat, and electricity. It would be as free as the air we breathe. Official acceptance of the authentic reality of UFOs would in turn lead to the acknowledgement of their free energy, and this would break up the economic system of the money changers. So they fight it.

The world's energy controllers have always been the major force in blocking the truth about UFOs from coming out. This cartel is made up of the oil corporations, the power companies, and the nuclear energy industries. And this cartel is actually above - and controls - the international bankers. With their complete dominance of the world's energy resources, the ongoing stability of the world economy is subject to their control, and this forces the many governments, both capitalist and communist, to do their bidding. Those that fear the truth coming out are those in control of the monetary system. Because if the propulsion of these spaceships became known, the energy controllers would be ruined, and their polluting industries obsolete.

The war profiteers are also a major force behind the coverup. The world's military spending now totals \$900 billion a year, with the United States and Russia counting for more than half the buildup. The superpowers keep fanning

the flames of war around the globe, because international marketing of armaments and nuclear weapons is the basis of the world economy. The U.S. national debt is two trillion dollars (and this debt is placed on the people), while defense corporations are making billions of dollars. There can never be real peace with a system of distorted wealth, because peaceful co-existence would disintegrate the privileged power system of the money changers. The world's population is being kept hostage under poised nuclear weapons, in order to serve a very few money changers. Life is as close as the Moon and planets, but our world will be on the brink of Armageddon and never know that the life is there. The slightest admission that there are peaceful civilizations bringing their visiting spaceships here to our planet would be devastating to the money system of the war profiteers.

So together, the energy cartel and the weapons industries have everything to lose, and therefore they do not want the truth to be known. The truth of UFOs and the truth of space would entirely expose how wrong our global priorities are. These powerful corporations are the force behind the international Silence Group, which has suppressed the truth about UFOs and censored the real knowledge behind planetary findings ever since the 1950's. This Silence Group has an interlocking chain of invisible control working through government intelligence agencies, multinational corporations, and even national institutions.⁹ This formidable group is in essence, a secret international government that serves the interests of the energy controllers, weapons producers, and bankers.

They have many ways of shaping events and many areas of influence to control. In their powerful conspiracy of world economics, they have many things to contend with, but we will restrict this discussion only to the issue of UFOs. The cartel has its own clandestine agencies working within the intelligence organizations of world governments. They have used every means to control and conceal the real UFO evidence from the public and scientific bodies. At the same time, this Silence Group insures that regular publicity is

given to weird tales and crackpot ideas, thereby keeping the idea of UFOs in a ridiculous light. They even plant obvious hoaxes in the press, and foster false contact claims through the media by paying imposters. The opposition wants the public to associate UFOs with cults, and with psychics claiming to receive bizarre messages from space "entities." Any crackpot scheme is played up to instill a sour impression in the minds of the public.

But the biggest part of the censorship extended into the national space program. Life and living planetary conditions beyond the Earth, which could have been revealed from the earliest probes, was totally suppressed. A lifeless, uninhabitable picture was deceptively documented, and public thinking manipulated, in order to protect the money system of the world. Left in ignorance about space, the masses have been unconsciously led to electing dark leaders who teach hate and revenge, who build more destructive weapons, and who aggressively lay the groundwork for 'wars and threats of war.' The early adventure of space has been replaced with the present militarization of space. We are now marking time. We are closer to biblical prophecy than the other road which could pave the way towards a glorious future.

What is the purpose behind this secret international government? It is to keep the monetary system from changing, despite whatever progress mankind makes socially. The masses will not change their thinking, unless there is a change coming from institutional thinking, or direct information on space from government bodies.

Nuclear weapons and star wars development are promoted today - only to defend our system of money which is a false god. Political leaders and their clever sophists have fully desensitized the common people to the constant talk of wars and arms buildup. Any pretext or propaganda used to fan fires and identify "enemies" is acceptable. The masses have been conditioned to go about their trivial pursuits and directionless lives, and to leave their collective fate to the gambling men of war. Perverse power has been gained by the

sudden exponential increase in arms selling in the 1980's by the superpowers. We are Atlantis today, slaves to habits from the past, and worshipping military might. Our fate is being decided by the false prophets of war and commercialism, and the dark forces in political power wield control by keeping the minds of the public confused, uncertain, and in fear.

We know that the space shuttle is for military purposes. It has nothing to do with space exploration or learning, but instead serves as a means to bring our war technology into orbit around the Earth. It will sometimes carry incidental scientific cargo, as part of the public relations hoopla, but the shuttle has really been developed for militarizing space around the Earth. It is not designed to get man into space, but to get man's weapons into space. Therefore it will not contribute to the advancement of man.

If the authorities were to admit the truth about UFOs and space, our whole approach would be forced to change. And rockets would now be outdated. In fact, there is no reason, except for economic ones, that we are still using rockets to artificially overcome gravity. We will never advance in capability, and we will never become a space civilization as long as we are stuck with rocket launching. It is primitive technology, and it opposes everything that this government knows about UFOs and their technology, and the government knows it. So do top scientists and the military.

Rockets are anything but true space machines. They go in one direction, one time, with a tiny crew strapped to tremendous G forces. And they are such an artificial way to overcome gravity, that the tremendous cost is a devastating expenditure.

Often our space visitors have been seen flying in huge formations of ships; occasionally a hundred or more would fly around an area together. Can you imagine seeing a hundred U.S. space shuttles flying together over California? The cost would be a trillion dollars. You would not see them hovering, nor would you see them for very long. They would soon be running out of fuel, be forced to land, then have to be towed to a launching facility. Each would have to be hooked

up again to multi-million-dollar booster rockets and external fuel tanks, and 100 earth-shattering blast-offs would be required to put them temporarily back in the sky.

This chapter is perhaps written a bit forcefully, but it is time to shake things up a little. We are out to counteract the insidious coverup regarding space conditions that has been perpetrated on the masses, leaving society lost and hopeless. "When goodness is mocked and good people thrown into despair; when the false, the cruel, and the diabolic are so powerful, it is not surprising that men's minds are stabbed with doubts." - (Paul Brunton) Men can only recover their faith in humanity and in themselves when the truth is known and understood.

Back when the UFO situation was a new and challenging field, there was seemingly a luxury of time to ponder over the information. Thirty years have changed all that. Our present world situation is acutely critical - precariously balanced on the edge of a cliff - and it's imperative that as much information as possible be brought out to the public regarding the truth behind the UFO evidence.

One should readily understand, that the Silence Group does not care if a few people learn the truth about planetary science (Venus, Mars, and the Moon), or if a thousand people learn, or even perhaps ten thousand. But if the common people learn the truth - if they are told - then there *is* a problem for the censors, because the number could soon reach millions. And the energy controllers and the billion-dollar defense industries would no longer have the unquestioned mass support that they always have had.

This is why Adamski's evidence and space information posed such a threat to those in opposition to the truth. His information reached millions of people, and society was waking up to the beauty and splendor of life and space. Adamski always advocated the benefits of our becoming a true space civilization. Mankind would advance in learning and understanding unlike any previous time in history. Our planet is just as important as any other planet, and it is an integral part of the household of life. Any dream one may

have, must have benefits here - on Earth. Not somewhere else.

Adamski always emphasized the need for our civilization to shift to a realistic space economy, and have interplanetary spaceships built here on Earth. Then man would be learning all the time, and becoming a true space civilization would lead us to greater cooperation and harmony on Earth. This would steer mankind away from his nuclear experimentation against Nature, and save this civilization. Knowing the truth about space sciences and the truth behind the UFOs, were the things that would advance man's understanding in order to make the Earth a better place to live. That has always been the importance of this field.

It is man's immature idea that the UFOs are an invitation for us to get out in space and we'll just leave the mess on Earth behind. No. It means work with each other and work with Nature here, in peace, so that we will be able to join in the adventure of space. The Earth is our home, and it is time we treat it with respect, and treat our brothers and sisters in every country with respect. Then we will be welcomed and helped to get in space. True space travel and visits to other planets would be our way of life.

The planets in our system are inhabited, and people of all planets except the Earth travel space freely. With their ships utilizing Nature's magnetic fields, the distance between planets can be covered within a few hours to a few days. Most spacecraft seen in our skies are from Venus. Smaller numbers are from Mars and Saturn, followed by visiting craft from other planets in our system. The space visitors are peaceful and friendly, and certainly human, but also very protective of us because we are all one interplanetary family in this solar system. But we on Earth do have to start earning our way a little, because open friendship cannot be extended if we refuse to believe in their existence, and as long as we do not express the will to live peacefully among nations on our own planet.
